

OUR ENVIRONMENTAL POLICY

Galactic is, by nature, a company that works in tandem with the environment.

As all our products are bio-based, natural, and bio-degradable, they contribute to a better environment through the progressive reduction of the company's carbon footprint and through the replacement of toxic or harmful substances based on traditional petrochemicals.

In adopting this environmental policy, Galactic clearly reaffirms its interest in this field by restating its principles and taking the opportunity to inform its entire staff and the world at large of them.

The implementation of this policy is in line with the company's principle of continuous improvement (receiving feedback also helps the improvement of the process).

This policy, based on both existing legislation and the specificity of our activities, provides a framework for action and also contains a clear statement of our objectives.

- Reduce environmental risks associated with our business activities whilst continuously conducting efforts to promote sustainable development with respect to human well-being and the improvement of our environment.
- Comply with environment-related legislation, regulations and requirements.
- Consider and take account of the ways in which we can prevent various forms of pollution in order to minimise the impact of our activities on the environment (water, air, soil, natural resources, flora, fauna, etc.) and human health.
- Develop a constructive dialogue with environmental authorities, institutions and agencies.
- Raise awareness of individual and collective responsibility of staff members in matters relating to environmental management and the environmental consequences stemming from their work.
- Inform staff of our environmental policy and communicate with them regularly about the results of actions taken in this field (in the case of an environmental problem, be proactive in informing local residents and provide answers to all their questions).
